DETAILED ACTION

Allowable Subject Matter

1. Claims 1-3 and 5-16 are allowed.
2. The following is an examiner's statement of reasons for allowance.

Regarding independent claims 1, 14 and 15. Prior art of record Dommaraju et al (7,558,234 hereinafter Dommaraju) teaches monitoring packets in a GPRS network and adding information to the record to determine whether multiple records should be combined (see claim 1) which enables for end-to-end call tracing to be preformed (see claims 5 and 6).

However, Dommaraju falls short of teaching a system, device and method for measuring and analyzing packet-switched traffic in a Universal Mobile Telecommunications System, UMTS, network having a mobile station linked to a base station through a radio channel, the base station being linked to a radio access network, and the radio access network being linked to a support node in a packet core network, wherein cell-level location information of the mobile station is obtained in a node in the radio access network, said method comprising: adding the obtained cell-level location information to user-plane packet headers when the radio access network detects that the mobile station is performing a handover; transmitting the user-plane packets carrying the cell-level location information towards the packet core network; measuring the cell-level location information, user data traffic, and packet data protocol, PDP, context information at the packet core network level; and determining end-to-end quality-of-service, QoS, metrics for the mobile station by analyzing the cell-level location

information, user data traffic, and PDP context information measured at the packet core network level as required in independent claims 1, 14 and 15.

Prior art of record McDonagh et al (7,328,262 hereinafter McDonagh) teaches architecture for capturing data from a mobile network and using it to generate per-user QoS metrics. McDonagh teaches using server-probe-tap architecture wherein the server merely transmits filtering commands to the probes in order to instruct the probes to capture and filter data when suspected problems arise at a particular part of the network (see claim 1).

However, McDonagh falls short of teaching a system, device and method for measuring and analyzing packet-switched traffic in a Universal Mobile Telecommunications System, UMTS, network having a mobile station linked to a base station through a radio channel, the base station being linked to a radio access network, and the radio access network being linked to a support node in a packet core network, wherein cell-level location information of the mobile station is obtained in a node in the radio access network, said method comprising: adding the obtained cell-level location information to user-plane packet headers when the radio access network detects that the mobile station is performing a handover; transmitting the user-plane packets carrying the cell-level location information towards the packet core network; measuring the cell-level location information, user data traffic, and packet data protocol, PDP, context information at the packet core network level; and determining end-to-end quality-of-service, QoS, metrics for the mobile station by analyzing the cell-level location

information, user data traffic, and PDP context information measured at the packet core network level as required in independent claims 1, 14 and 15.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
